## **Bill Verplank**

says that the Interaction/UX Designer has three questions to answer; they are all "How do you . . . ?" questions.

### 1. "How do you do?"

How do you affect the world?

You can grab hold of a handle and manipulate it, keeping control as you do it.

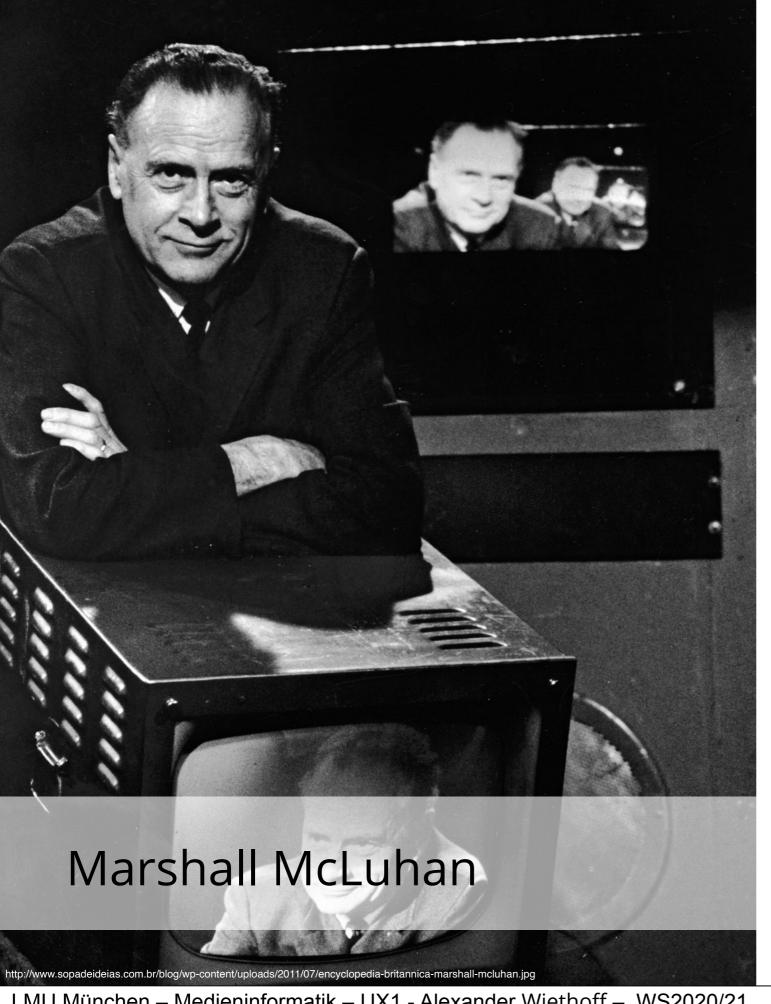

### 2. "How do you feel?"

How do you get feedback?

That's where a lot of feelings come from; a lot of our emotions about the world come from the sensory qualities of those media that we present things with.

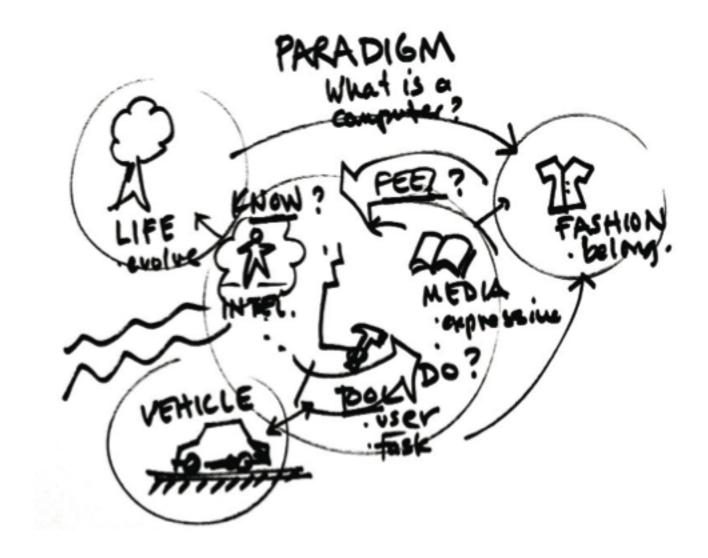

### 3 "How do you know?"

The map shows the user an overview of how everything works, and the path shows them what to do, what they need to know moment by moment

"Any hot medium allows of less participation than a cool one, as a lecture makes for less participation than a seminar, and a book for less than a dialogue."

### **Interaction Design Paradigms**

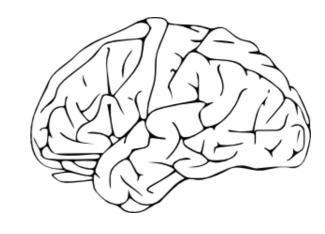

**A paradigm** is an example that serves as a pattern for the way people think about something.

It is the set of questions that a particular community has decided are important. For interaction design there is often some confusion about what paradigm you are working with. The basic question is, What is a computer?

## **Intelligence**

In the early days, designers thought of computers as people and tried to develop them to become smart, intelligent, and autonomous.

The word "smart" is one that we associate with this paradigm, expecting the machine or product to be smart and to know how to do things for the person who uses it.

### Tool

Doug Engelbart, the inventor of the computer mouse, thought of the computer as a tool.

Styles of interaction changed from dialogs, where we talk to a computer and a computer will talk back to us, to direct manipulation, where we grab the tool and use it directly. The ideas of efficiency and empowerment are related to this tool metaphor.

### Media

In the nineties, designers thought of computers as media, raising a new set of questions.

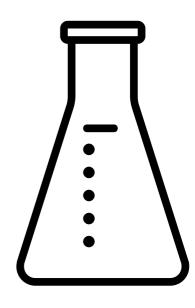

How expressive is the medium? How compelling is the medium? Here we are not thinking so much about a user interacting with or manipulating the computer, but more about them looking at and browsing in the medium.

### Life

Starting in the mid nineties, people have been talking about computer viruses or computer evolution; they are thinking of artificial life.

When the program has been written, it is capable of evolving over time—getting better and adapting. The programmer is in a way giving up responsibility, saying that the program is on its own.

### **Vehicle**

Another metaphor is the computer as vehicle, and we have to agree on the rules of the road.

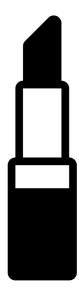

There has to be some kind of infrastructure that underlies all computer systems. People spend their careers determining the standards that will define the infrastructures, and hence the limitations and opportunities for design.

### **Fashion**

The media metaphor plays out to computers as fashion.

A lot of products are fashion products. People want to be seen with the right computer on. They want to belong to the right in-crowd. Aesthetics can dominate in this world of fashion, as people move from one fashion to another, from one style of interaction to another style.

# Getting the right Design and the Design right...

Bill Buxton - Sketching User Experiences

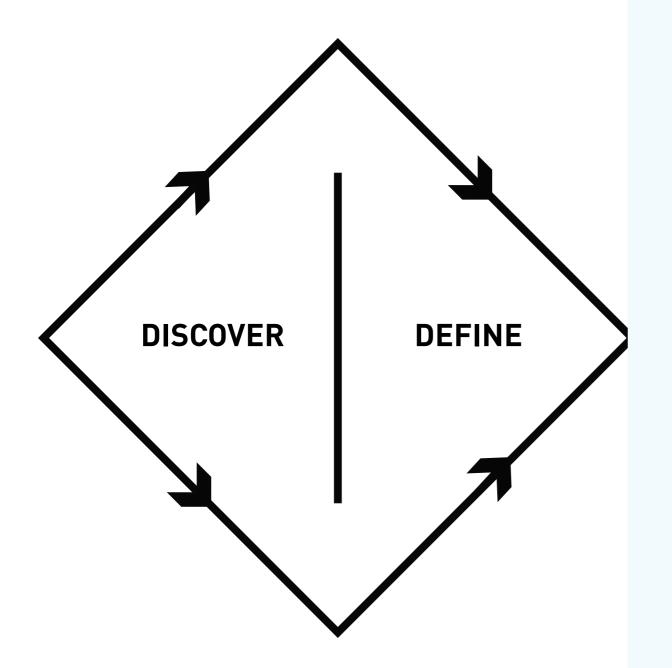

### **DISCOVER STAGE**

- Consumer behaviour and preferences in relation to the product or service offered by the company
- New modes of communication
- New service needs that may emerge on the basis of social, economic or environmental changes

The Discover stage helps to identify the problem, opportunity or user need that should be addressed, and introduces the space within which design can provide a solution – the playing field for design. It is important that the design process used in the company allows for ideas to be captured and developed in this way, and fosters this type of creative environment among designers and other staff.

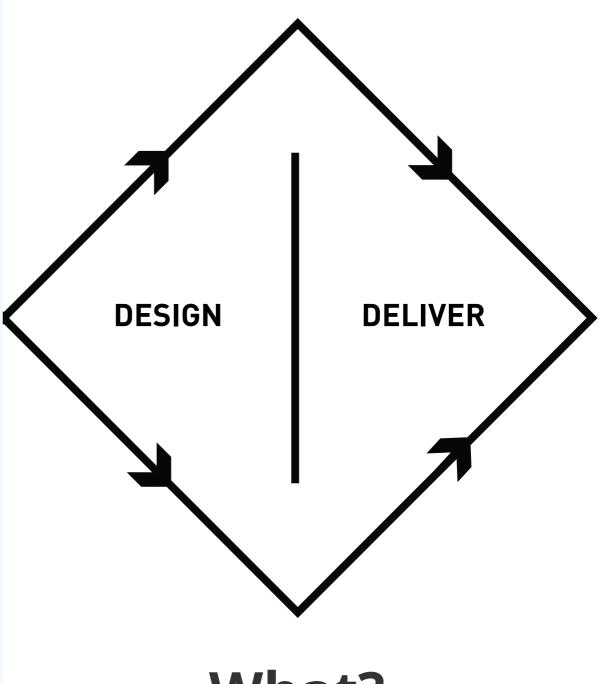

### **DEFINE STAGE**

- The generation of initial ideas and project development
- Ongoing project management
- Corporate objectives agreed and project sign-off

At the Define stage, a combination of the ideas or directions identified during the Discover stage are analysed and synthesised into a brief with actionable tasks related to new and existing product or service development. The Define stage ends with a clear definition of the problem(s) and a plan for how to address this through a design-led product or service. In practice, the Define stage ends in a project goahead through corporate level sign-off.

### **DESIGN STAGE**

- Multi-disciplinary working and dependencies with other departments
- Visual management
- Development methods
- Testing

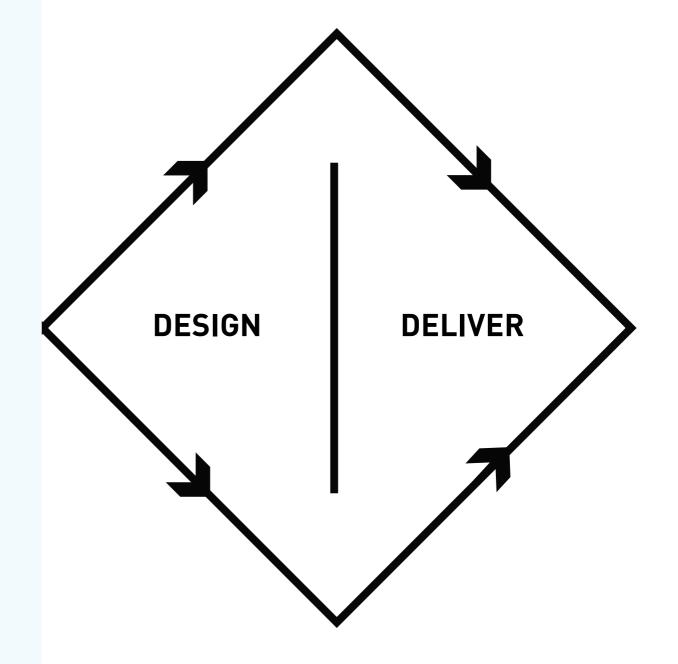

What?

### **DELIVER STAGE**

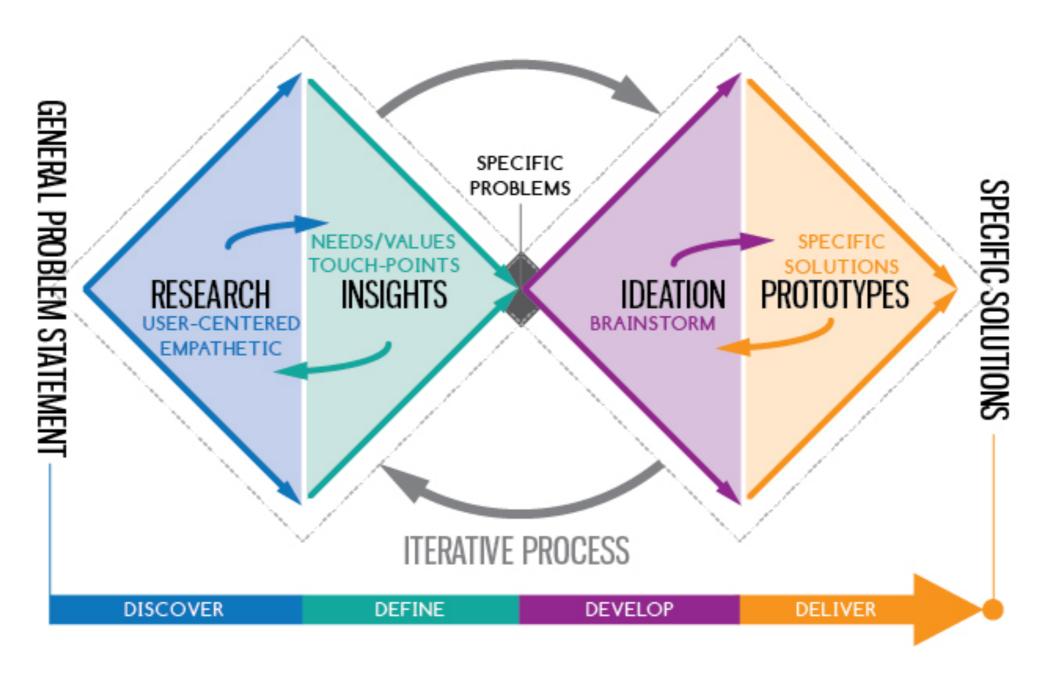

- Final testing, approval and launch
- Targets, evaluation and feedback loops.

It will result in a product or service that successfully addresses the problem identified during the Discover stage. It will also include processes for feeding back lessons from the full design process to inform future projects, including methods, ways of working and relevant information.

## Appearance/Affordances

### **Appearance**

Appearance is the major source (texture is the other) of what cognitive psychologist James Gibson, in 1966, called **affordances**.

Gibson explored the concept more fully in his 1979 book *The Ecological Approach to Visual Perception*, but it wasn't until Don Norman's seminal book *The Psychology of Everyday Things*, in 1988, that the term spread into design.

An **affordance** is a property, or multiple properties, of an object that provides some indication of how to interact with that object or with a feature on that object.

source: [2&5]

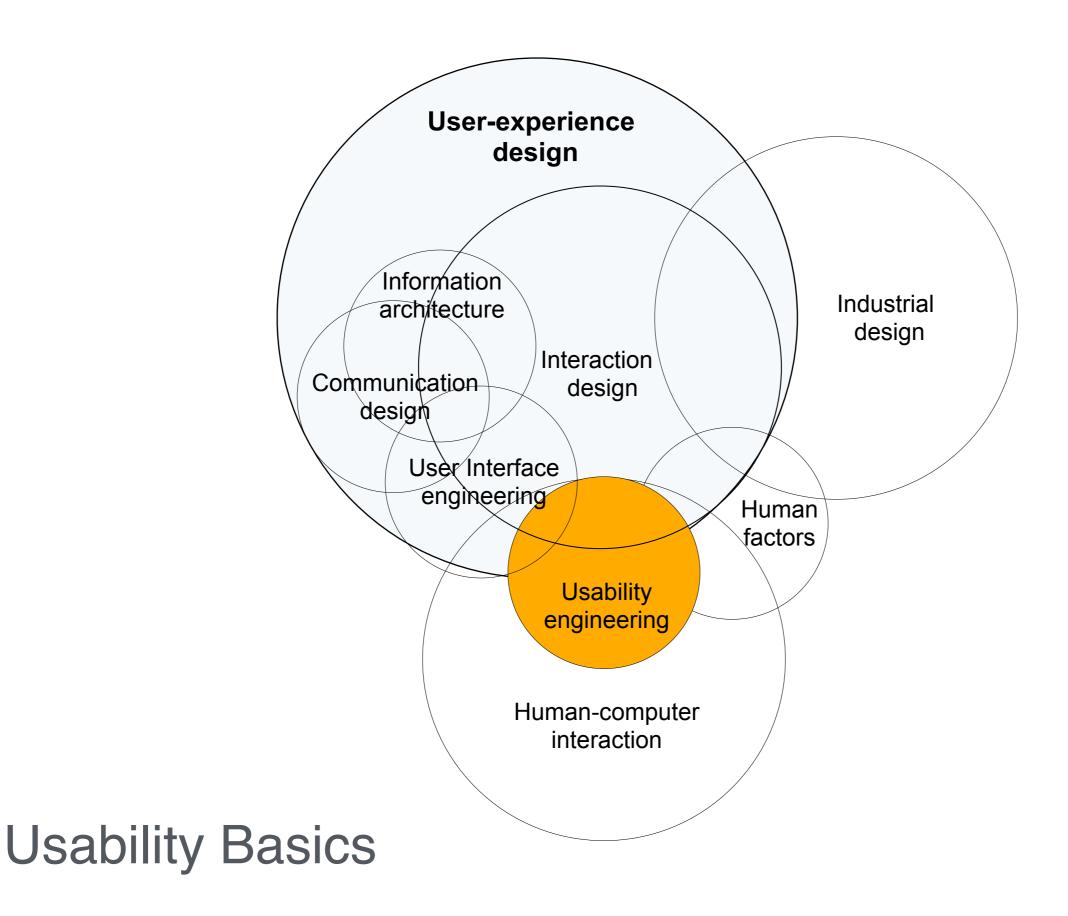

Appearance/Affordance has many variables for interaction designers to alter:

- 1. proportion
- 2. structure
- 3. size
- 4. shape
- 5. weight
- 6. color (hue, value, saturation)

All of these characteristics (and more) add up to appearance, and nearly every design has some sort of appearance, even if that appearance is a simple command line.

## Process Models, Elements and Usability

- Definition and Paradigms of UX/Interaction Design
- Process Models
- Elements of UX/Interaction Design
- Usability I

Usability is a term used to denote the ease with which people can employ a particular tool or other human-made object in order to achieve a particular goal.

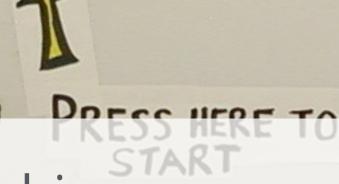

## Benefits of usability testings

- Higher revenues through increased sales
- Increased user efficiency
- Reduced development costs
- Reduced support costs

Hierarchy of Design Needs (Lidwell: Universal Principles of Design, 2003)

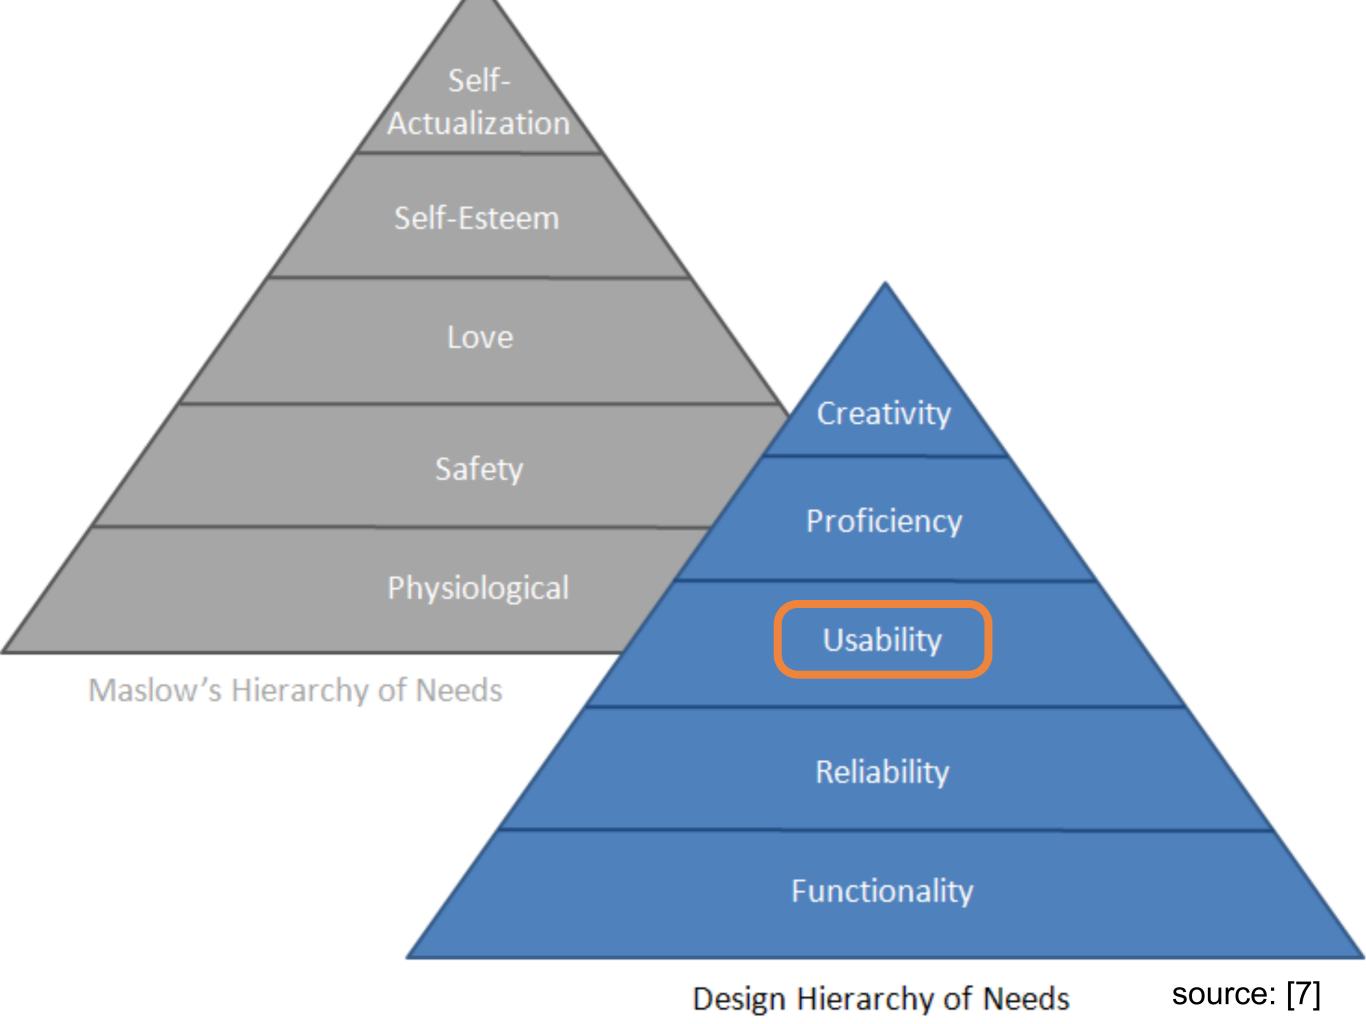

Functionality needs have to do with meeting the most basic design requirements.

For example a HDD recorder must, at minimum, provide the capability to record play, and review recorded programs. Designs at this level are perceived to be of little or no value.

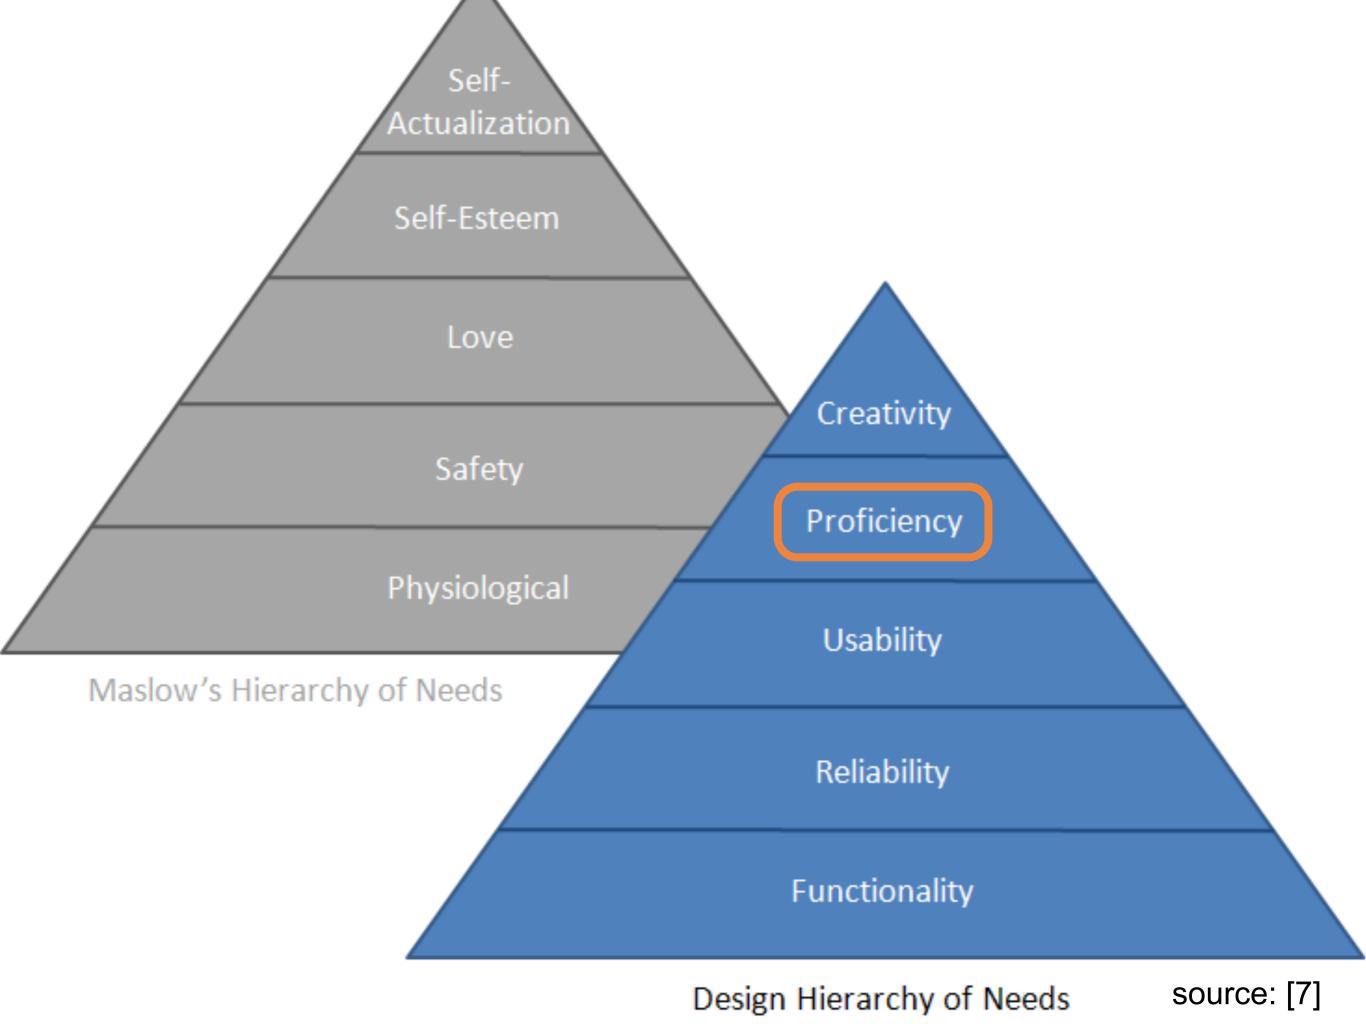

# Reliability needs have to do with establishing stable and consistent performance.

For example a HDD recorder should perform consistently and play back recorded programs at an acceptable level of quality. If the design performs erratically, or is subject to frequent failure, reliability needs are not satisfied. Designs at this level are perceived to be of low value

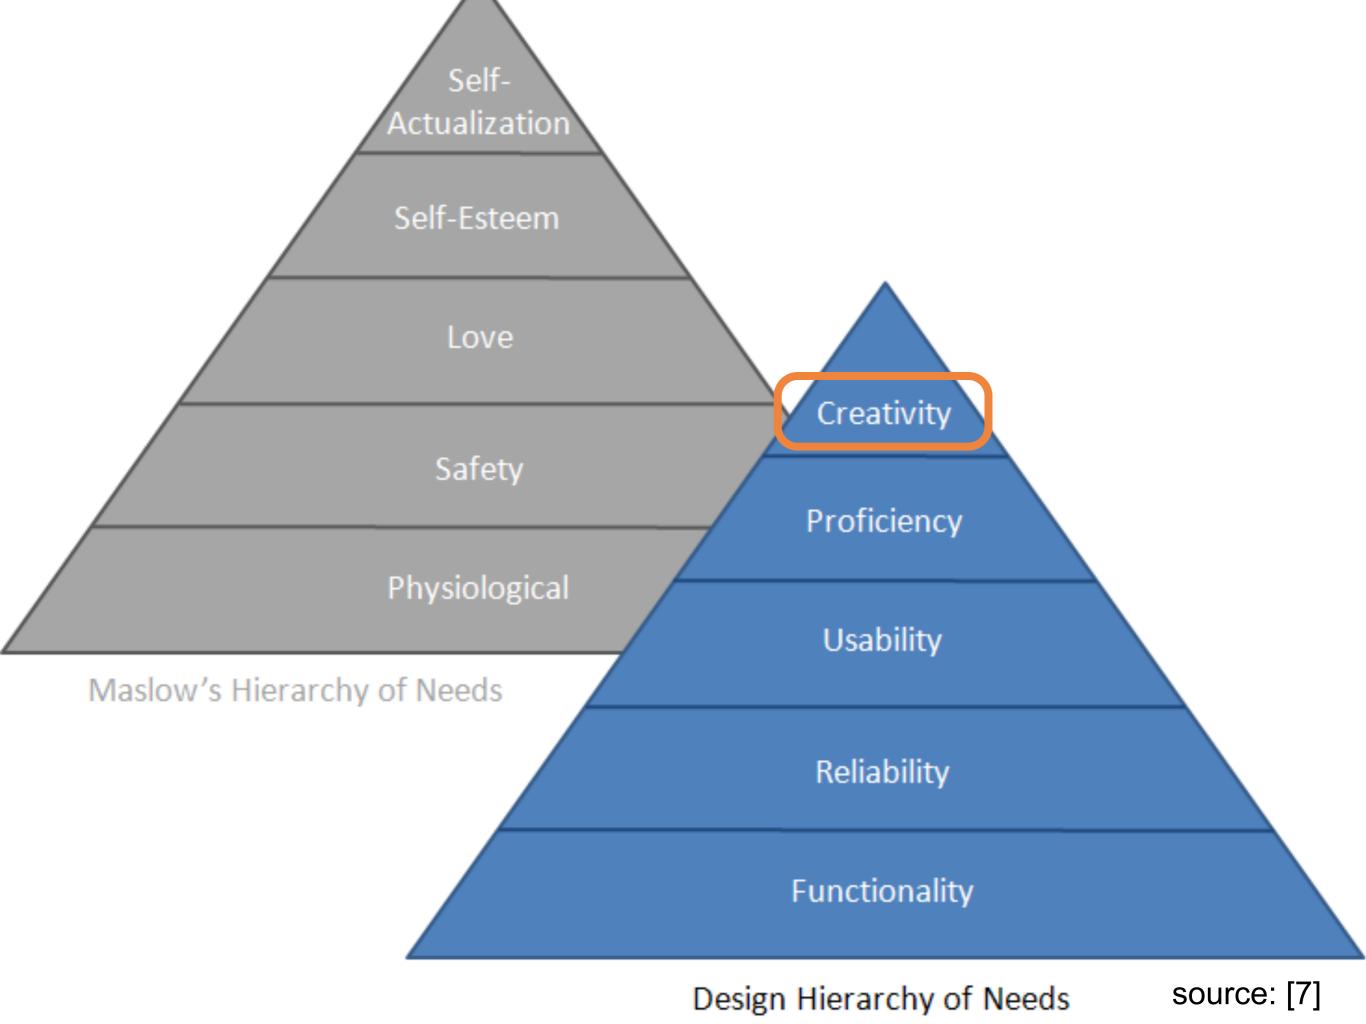

# Usability needs have to do with how easy and forgiving a design is to use.

For example, configuring a HDD recorder to record programs at a later time should be easily accomplished, and the recorder should be tolerant of mistakes. If the difficulty is too great, or the consequences of simple errors too severe, usability needs are not satisfied. Designs at this level are perceived of moderate value.

# Proficiency needs have to do with empowering people to do things better than they could previously.

For example, a HDD recorder that can seek out and record programs based on keywords is a significant advance in recording capability, enabling people to do things not previously possible. Designs at this level are perceived to be of high value.

Creativity is the level in the hierarchy where all needs have been satisfied and people begin interacting with the design in innovative ways.

The design, having satisfied all other needs, is now used to create and explore areas that extend both the design and the person using the design. Designs at this level are perceived to be of the highest value, and often achieve cult-like loyalty among users.

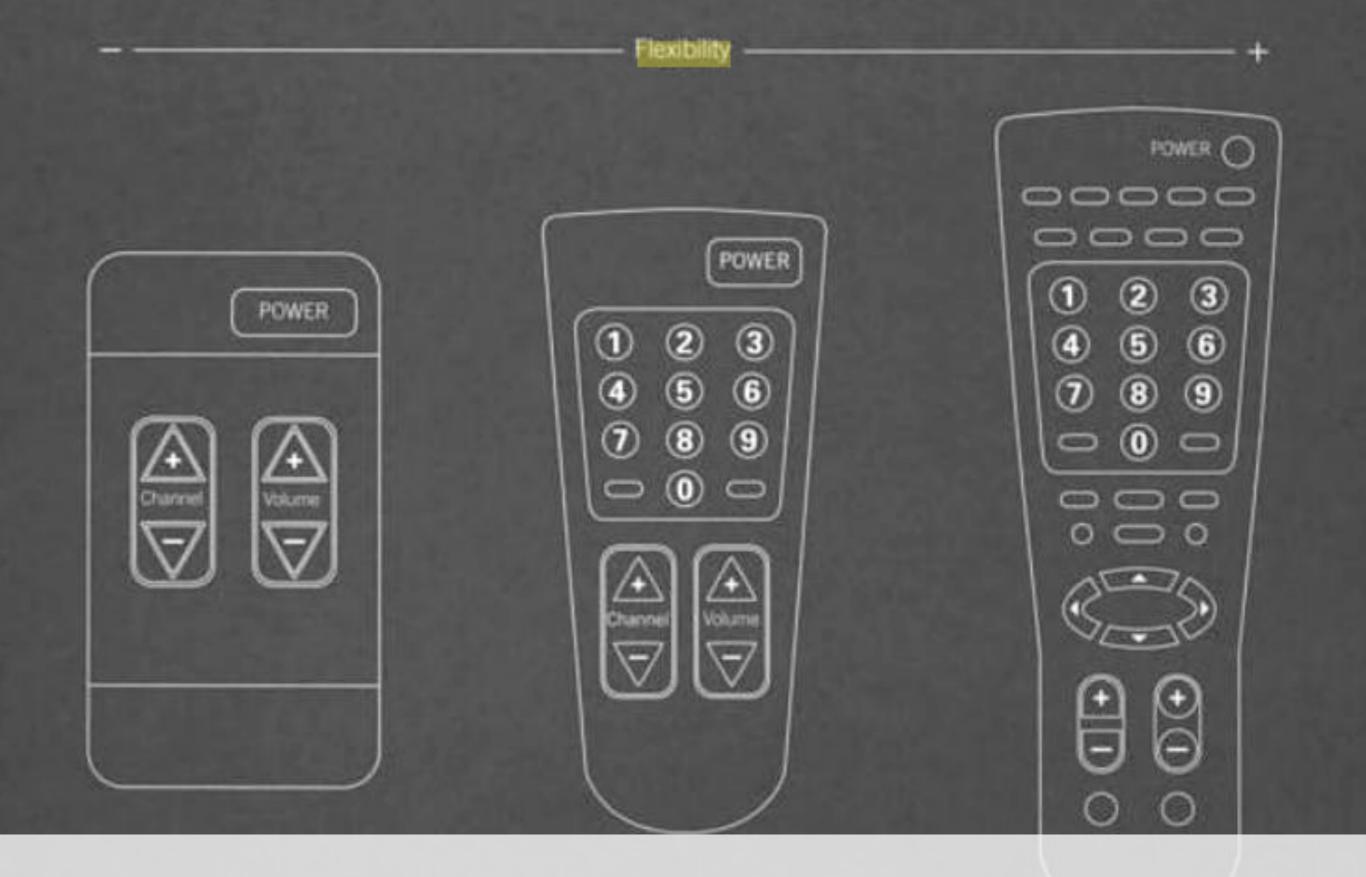

Aesthetic designs are perceived as easier to use than less-aesthetic designs.

Aesthetic designs look easier to use and have a higher probability of being used, whether or not they actually are easier to use.

The flexibility-usability tradeoff is exemplified in the well known maxim "jack of all trades, master of none". Flexible designs can perform more functions than specialised designs, but they perform the functions less efficiently.

## iPhone 6

## Navigation gives us something "to hold on"

It tells us what we'll find and establishes a level of trust between the user and the people who build the system

It is relatively easy to design for the perfect cases, when everything goes right, or when all the information required is available in proper format.

Heuristic (hyū-'ris-tik) is a method to help solve a problem, commonly an informal method. It is particularly used to rapidly come to a solution that is reasonably close to the best possible answer, or 'optimal solution'.

# Paperprototyping & Wireframes

# What is it?

Paper prototyping is a widely used method in the usercentered design process, a process that helps developers to create products/screen based applications that meets the user's expectations and needs.

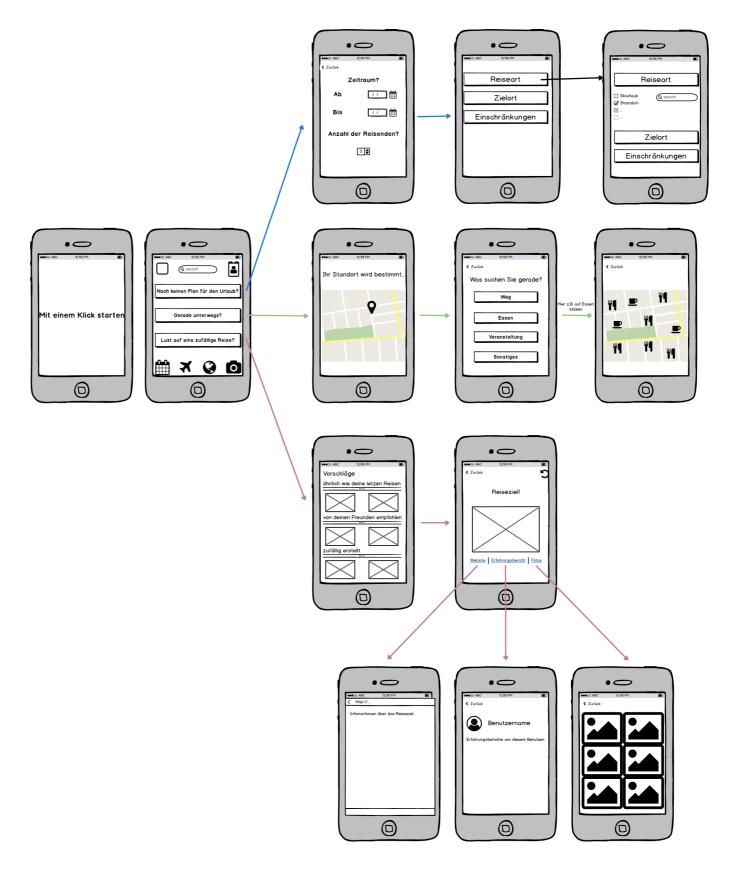

It is throwaway prototyping and involves creating rough, even hand sketched, drawings of an interface to use as prototypes, or models, of a design.

# History

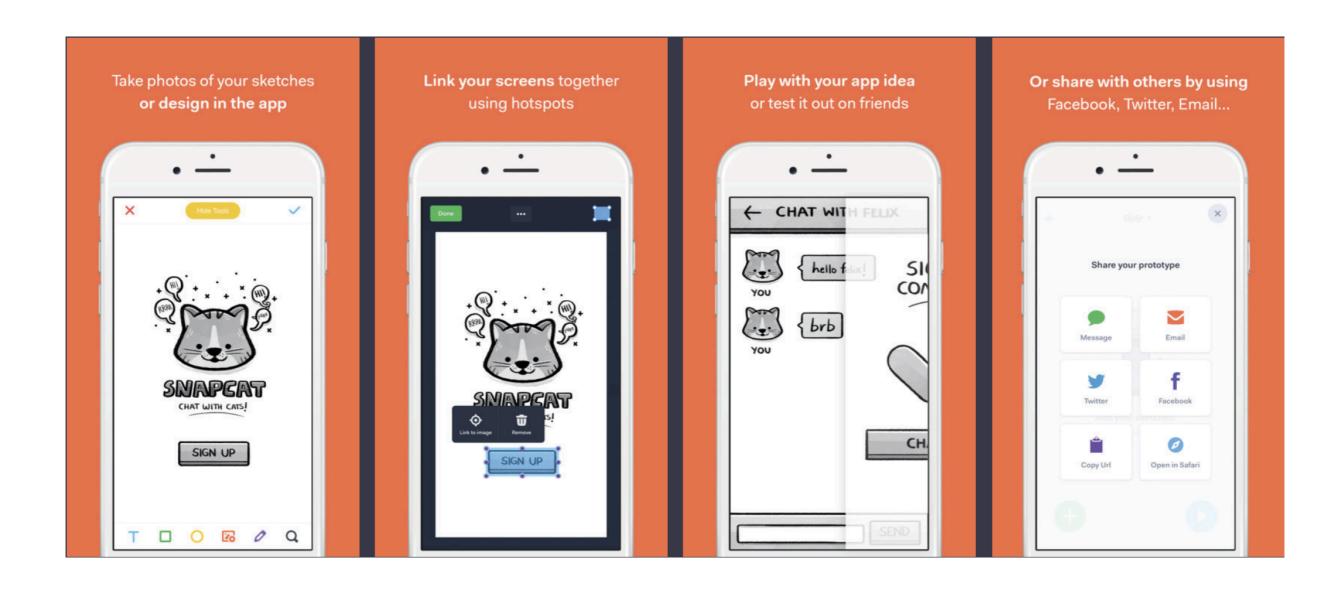

Paper prototyping started in the mid 1980s and then became popular in the mid 1990s when companies such as IBM, Honeywell, Microsoft, and others started using the technique in developing their products.
